

Flow Builder

**Several workstreams moving.
Without getting in each other's way.**

Deep product discussions.

Clear decisions about what runs together—and what waits.

THE PRODUCT MANAGER'S
BURDEN

What can run together?

The product manager
must connect it all.
Which changes overlap?
What depends on what?

WITHOUT A SHARED PROCESS

Two good ideas. One shared feature.

Design wants a new flow.
Tech is changing its logic.
Who connects the plans?

Deep discussions. Clear shared decisions.

Without FB: separate chats without a shared process. These are risks, not inevitable failures.

Without FB: the problem	With FB: the response
Tech changes a constraint. Design still uses the old one.	Product/BFM flags conflicting assumptions before building.
Many ideas were explored. The agreed scope is unclear.	FB separates ideas, decisions and open questions in one plan.
A discussion reopens. Its recommendation's outcome is unclear.	FB returns the outcome and evidence to that workstream.

Product/BFM = Build For Me. Illustrative risks and intended workflow.

Parallel work. Clear priorities and trade-offs.

Codex already supports agents and worktrees. FB adds a repeatable coordination process.

Without FB: the problem	With FB: the response
Several changes are ready. Their overlap is unclear.	Product/BFM identifies what can run together and what must wait.
Separate branches pass. The combined result may not fit.	FB uses a shared brief and checks the integrated result.
An urgent request arrives. Existing commitments may slip.	Product/BFM shows what pauses, moves or continues.
Stakeholders want different priorities. What should come first?	Product/BFM proposes an order using goals, impact and dependencies.
Stakeholders ask why work moved. The trade-off is hard to explain.	FB records the decision and its impact to help the manager explain the plan.

YOUR AMBITION

**Go deeper.
Keep
exploring.**

Ask follow-ups.
Challenge assumptions.
Return with new
evidence.

WITH FB

Exploration can stay exploration

Keep the conversations going.
A useful idea does not start a build.

When ready: \$bfm in Product/BFM (Build For Me).

WITH FB

Deep discussions. A shared delivery plan.

Independent work
together.
Shared dependencies in
order.

WITH FLOW BUILDER

**Some work
runs
together.
Some must
wait.**

Parallel investigation.
Isolated
implementation.
Coordinated integration.

Six ongoing conversations, one delivery queue

Investigate deeply in parallel chat threads. Handoffs capture actionable conclusions, not entire chats.

The product manager invokes \$bfm to start planning.

A REAL BFM PREVIEW

See the plan. Before the build.

What runs first.
What waits—and why.
What will actually change.

Review. Reorder. Then say okay.

After \$bfm · Before implementation

Handoff	Proposed decision	What happens
 Handwritten buttons	Include now · first	Implement the newly approved visible-button and Kalam-label treatment across the Android journey.
 Camera-app return	Include now	Verify the existing same-trail continuation on Samsung.
 Still-photo shutter	Include now	Retain the integrated camera glyph; verify its native appearance and behavior.
 No-tail elephant	Include now	Retain the integrated mark; check it stays consistent.
 Heart-body launcher icon	Include now	Retain the existing icon, with the later no-tail correction.
 Sunlit type and icon correction	Include now	Verify the existing native treatment alongside the new buttons.
 Picture-led Help	Include now	Verify the integrated Help flow and its newly button-shaped actions.
 Elephant placement	Include now	Keep the approved restrained placement and check contrast.
 Platform concept boards	Deferred	Reference only; no iPhone implementation or new visual direction.
 Competitor study	Deferred	Preserve the research; no field study in this build.
Business has no new candidate. Bugs has one blocked rapid-tap handoff, retained for candidate verification; Product/BFM owns integration. The existing Product U'  didate remains the source-work area. Next I would implement the button treatment there, run focused and whole-candidate checks, then verify normal and enlarged		

Parallel where independent. Sequenced where shared.

Product/BFM proposes the queue. The product manager approves the scope.

Results return to workstreams → evidence → next handoff

Failed check → one consolidated repair → failed proof only. Unresolved/no progress → Product decision.

WHEN PRIORITIES CHANGE

All work to be done has a cost

Export moves first.
Design waits.
Its prerequisite still matters.

An urgent request changes the plan

Illustrative example: leadership asks for an export feature before a design refresh.

BEFORE

- 1 Design refresh
- 2 Export feature
- 3 Search improvement

AFTER PRODUCT/BFM RECONCILES

- 1 Resolve export prerequisite
- 2 Build and verify export
- 3 Resume design refresh

Still blocked: export waits for its prerequisite.
Displaced: design refresh moves later.
Can continue: independent search investigation.

BACK IN THE WORKSTREAM

The next conversation starts with the outcome

Completed Blocked Deferred

Keep learning in the same workstreams.

Flow Builder

1. Install FB in Codex

Open your project. Paste this into a Codex chat:

Install or update FB from
<https://github.com/friedbeef1/fb-lane-coordination>
and set it up in this project.

Already installed? The same prompt handles the upgrade.

2. Set up your project

After a fresh installation or upgrade:
open a new Codex task, then say

\$fb-setup

FB creates or reuses your project's seven pinned chats.

Product/BFM + User, Business, Design,
Tech, Discovery and Bugs

3. Discuss, plan, build, release

DISCUSS	Explore in the relevant workstream chats.
HAND OFF	When ready, say "Send this to Product/BFM."
START	Say \$bfm in Product/BFM. Approve the plan.
VERIFY	FB coordinates parallel work and checks.
RELEASE	At Ready to ship, say "Push Live".

Thank you. Let's connect.

Flow Builder is Open Sourced on Github and available now for Codex.
